No. is the number of results predicted by chance to have a score of the speater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                            938

                                      This sequence represents Thermomyces lanuginosus TL-gamma, a novel ATP-dependent, plus and-directed incrotubule motor protein that is a member of the unc-104 family and kinesin superfamily. The invention provides TL-gamma nucleic acids (see X87655), proteins and antibodies, and methods of screening for TL-gamma modulators potentially useful for treating hyphal fungal infections and diseases caused by muctaed TL-gamma, e.g. neurodegeneration involving anterograde axonal transport, such as Alzheimer's, Parkinson's or Huntington's diseases or amyotrophic lateral sclerosis. Detection of TL-gamma allows differentiation between hyphal and non-hyphal fungal infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         JUN
C77607 to C78448 encode the human cancer associated proteins given in B43398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: Cycostatic, proliferative; vulnerary; immunomodulator; antidiabetic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; antisthmatic; constituted for participation or participation; and diagnosing pathological conditions. Polymucleotides and conditions and diagnosing pathological conditions. Polymucleotides, or polypeptides, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to reactions, graftly expense and organ rejection, cancers, cardiovascular disorders, neurological disease and bacterial or cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, unlabodies, agonists and antagonists may be also be used in drug screens. C78449 to C78457 and excerting materior.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6

  New SOC/CRAC calcium channel polynuclectides and polypeptides used to diagnose and treat proliferative disorders associated with the channel, and to screen for novel modulators of the channel.
                              122 llsge----svptalggpepvihniifwsngftvddgplrklddpenasfldsirksec 176

  ---GTPRSDDDGDALFFGDKKSKQDA 157
  The present sequence is that of a Caenorhabditis elegans polypeptide at the Cósil. 3 locus. The polypeptide was identified in a database search for putative calcium channel proteins. The COSOIL 3 protein was noteable cause its central porr eggion had some similarity to, but was clearly distinct from, members of the Trp family of calcium chemnels. The polypeptide was used in BLAST screening to isolate 2 other C. elegans homologues (see Y95481-42) and mouse melastatin-1 (see Y95483). Those were used to screen EST databases for lymphocyte homologues. Human clones (see H9922-14) encoding members (see Y95483-37) of a new family of Soc (store operated channel) or CRAC (calcium release activated channel) calcium channel polypeptides were identified.

The Invention relates to an inducible progression-elevated gene-3 (PBG-3 gene) regulatory region functionally inhed to a gene encoding a product that causes or may be induced to cause the death or inhibition of cancer cell growth. A vector of the invention which contains a gene encoding thymidine kinase or a product which causes the cell to express a specific antigen can be administered along with gancyclovir or a cyclovir, or an antibody or fragment to the antigen, respectively. To treat cancer in a subject. The PBG-3 gene is useful for generating new cloning and expression vectors, transfected cells, and for developing methods for cultured growth of such cells. The PBG-3 polynucleotide is also useful as a source of primers and probes to study the progression of cancer, and to detect the presence of the gene. The present sequence represents the amino acid sequence of the rat gadd34 protein.

  A hybrid protein in which the P.Vivax Duffy receptor is joined to the CD4 receptor molecule, both molecules being truncated at their transmembrane domains, is specifically claimed. The fusing or joining of the two segments takes place by joining amino acid segments takes place by joining amino acid segments of any uspecified sites by disuphide boads or by cross-linking agants of any type. The fusion protein can bind free HIV in the blood to red blood calls and consequently reduce viral titre, prevent transmission of the virus and improve safety of blood transfusions. The specification also includes the sequence of amino acids 1.311

The sequence was deduced from clones isolated from a p. vivax genomic library. The sequence covers 4 exons and has a 22 amino acid signal sequence, an 18 AA transmembrane segment (exact posn. not given) followed by 45 AAs at the C-terminus. The protein lacks bethe repeat region of the corresponding protein from p. Knowless but both have two regions of high Cys content are separated by a Proriectory of the gene can be used to express recombinant buffy see also proteins for use in vaccines for malaria.

This sequence represents the full length Duffy antigen binding protein (DABP). Data and the shall call binding protein (SABP) are soluble proteins that appear in the culture supernatent after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the trachment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the varia, var. 3 or var. 7 genes of the DBL gene family, a family of genes having homology with conserved respons of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducting a protective immune response in a mammal to Plasmodium

Seque
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
